COMPARISON VERDICT

One problem-solving method. Three different systems.

Tixora and Fundscope now follow the same evidence-to-solution logic as the Intelligent Pricing Model for Airbnb Hosts. The content changes by domain; the reasoning sequence does not.

Discover
External evidence, primary research, survey or observed behavior, and competitive analysis.

Define
Synthesis, users and journeys, requirements, and a focused problem statement.

Develop
Divergent ideas, prioritization, flows, and low-to-high fidelity iteration.

Deliver
Three test rounds, final system, accessibility rules, outcomes, and next scope.

29
REFERENCE SECTIONS IN THE INTELLIGENT PRICING MODEL

20
PAGES IN THE CURRENT TIXORA REPORT

21
PAGES IN THE CURRENT FUNDSCOPE REPORT

The correct goal is not to copy Airbnb content. It is to make the same chain of evidence, decisions, iteration, and validation visible.

What matches

Research comes first; synthesis narrows the problem; ideation stays visible; screens evolve by fidelity; testing changes the work; the final system closes the loop.

What remains domain-specific

The pricing report needs datasets and model logic. Tixora needs commerce continuity and trust. Fundscope needs analytical meaning, state, and review readiness.

REFERENCE SPINE

The Intelligent Pricing Model proves the work from context to validation.

Its strength is not the Double Diamond label. Its strength is that every phase contains visible evidence, artifacts, decisions, screens, and test-driven changes.

1. **Frame the opportunity**
   Executive summary, introduction, background, objectives, research questions, scope, and methodology.
2. **Build the evidence base**
   Secondary research, the New York City dataset, competitive analysis, machine-learning context, primary research, survey findings, and interviews.
3. **Synthesize the evidence**
   Top insights, personas, journey maps, thematic analysis, participant language, and design recommendations.
4. **Make and evaluate**
   Ideation, model methodology, design process, low fidelity, Round 1, mid fidelity, Round 2, style guide, and high-fidelity iteration.
5. **Close the loop**
   Round 3, user feedback, future considerations, scope, and references.

Benchmark rule

Each research artifact must change a design decision. Each iteration must respond to evidence. Each final screen must trace back to a requirement.

Evidence breadth

- 6 interviews and 21 surveys are identified in the report summary.
- Primary and secondary evidence are kept distinct.
- Competitive findings sit before concept development.
- Thematic synthesis bridges research and recommendations.

Iteration depth

- Low, mid, and high fidelity are shown as a progression.
- Three usability rounds make change visible.
- The final visual system follows validated structure.
- Future scope acknowledges what the delivered solution does not yet cover.

> This is the standard Tixora and Fundscope should match: traceability and problem-solving depth, not identical section names.

EVIDENCE FIRST

All three start by proving the problem exists.

The domains require different evidence, but the same research logic is present: learn from people, test prevalence or behavior, review published knowledge, and inspect the competitive landscape.

EVIDENCE LAYER	PRICING MODEL	TIXORA	FUNDSCOPE
Primary research	Host interviews and survey.	14 buyer interviews; 8 live walkthroughs.	12 interviews across institutional roles; contextual observation.
Quantitative proof	21 survey responses plus the NYC dataset.	230-response survey sizes fee, account, mobile, and trust themes.	184-response survey sizes workflow, comprehension, and alert friction.
Secondary research	Pricing drivers, spatial data, review sentiment, and model evidence.	Published checkout evidence connects friction to design constraints.	Peer-reviewed dashboard studies connect form, structure, and task fit to comprehension.
Competition	Pricing tools are compared for features, strengths, and weaknesses.	Ticketing platforms reveal a continuity opportunity across search and checkout.	Institutional platforms reveal an orientation opportunity inside analytical depth.
Research output	Influential pricing variables and gaps in current tools.	Where purchase confidence breaks before payment.	Where analytical meaning or context becomes unstable.

● Direct method match ● Domain-equivalent artifact ● Domain-specific evidence

MATCH
Research before solution

None of the reports begins with screens or a preferred feature.

EQUIVALENT
Proof takes different forms

Pricing uses a dataset; Tixora uses checkout evidence; Fundscope uses dashboard cognition research.

KEEP VISIBLE
Method-to-decision link

Every evidence block should end with the decision or constraint it created.

SYNTHESIS IS WHERE THE PROBLEM BECOMES SOLVABLE

All three convert raw evidence into a focused design challenge.

SYNTHESIS MOVE	PRICING MODEL	TIXORA	FUNDSCOPE	ALIGNMENT
Cluster evidence	Thematic analysis and top insights.	126 notes organized into five affinity clusters.	146 coded notes organized into six themes.	**Full**
Keep users concrete	Personas and journey maps.	Two behavioral modes and a six-stage purchase journey.	Role archetypes and a six-stage analytical path.	**Equivalent**
Use participant language	Key insights in participants' words.	Quotes appear inside each affinity cluster.	Quotes and observed workarounds support each theme.	**Full**
State the problem	Hosts lack transparent, data-informed pricing support.	Confidence decays when context, cost, or control disappears.	Meaning becomes unstable as users move from signal to explanation.	**Full**
Translate into requirements	Design recommendations and model requirements.	Visible total cost, retained selection, optional identity setup, and credible recovery.	Persistent scope, stable units, visible state, question-matched views, and review readiness.	**Full**

The shared logic

Observation → cluster → insight → problem → requirement → success signal.

This sequence is the real Define phase. It explains how research changes the product.

Do not force identical artifacts

An empathy map is useful only when it reveals needs not already clear in the affinity map. Fundscope can use role-based workflows instead; Tixora can use journey breakdowns. The required output is a defensible problem, not a checklist.

> Verdict: Tixora and Fundscope match the reference method. Their user models are equivalent to the pricing report's personas and journeys, but tuned to the behavior each system must support.

IDEAS MUST BE VISIBLE

All three show divergence, selection, and screen evolution.

Pricing model

- Design recommendations
- Ideation into Metrix
- Model methodology
- Storyboarding and user flow
- Low fidelity
- Mid fidelity
- Style guide
- High-fidelity iterations

Tixora

- 48 ideas across six opportunity territories
- Impact-confidence-effort prioritization
- Six-stage purchase architecture
- Low-fi task order
- Mid-fi price and state hierarchy
- High-fi cross-platform flow
- Explicit dropped or deferred concepts

Fundscope

- 38 ideas and three structural models
- Evidence-fit and feasibility scoring
- Six-stage analytical architecture
- Low-fi reading order
- Mid-fi scope and comparison controls
- High-fi analytical priority
- Explicit dropped concepts

REQUIRED PROOF	WHAT A REVIEWER SHOULD SEE	WHY IT MATTERS
Idea generation	Opportunity areas, candidate concepts, and alternatives - not only the winning solution.	Shows the team explored the problem rather than decorating the first idea.
Selection rationale	A scoring or prioritization method tied to research, impact, confidence, effort, and accessibility.	Makes convergence defensible.
Iteration screens	Low-, mid-, and high-fidelity screens with callouts for what changed and why.	Turns process language into observable design work.
Discarded directions	What was dropped, deferred, or merged - and the evidence behind the decision.	Demonstrates judgment, not output volume.

> Verdict: both new reports meet the pricing report's problem-solving standard. The most important visual requirement is to place iteration screens beside the finding that triggered each change.

VALIDATION CLOSES THE EVIDENCE CHAIN

Three usability rounds connect the final system to observed change.

DELIVERY PROOF	PRICING MODEL	TIXORA	FUNDSCOPE
Round 1	Tests low-fidelity task structure.	Six participants test selection, review, and guest checkout.	Five participants expose priority, filter-scope, and continuity risks.
Round 2	Tests mid-fidelity comprehension and flow.	Six participants test hierarchy, price recall, and recovery.	Five participants test comparison scope, state language, and keyboard paths.
Round 3	Validates the high-fidelity experience.	Six participants test the responsive end-to-end journey.	Five participants test the final overview-to-review path and non-color status.
Final system	Metrix joins model logic, host controls, and a visual system.	Discovery, ticket choice, review, guest details, payment, recovery, confirmation, and access work as one flow.	Overview, signal, filter, compare, inspect, and review preserve analytical meaning.
Outcome layer	User feedback, future scope, and references.	Verified conversion, task-time, and click-through outcomes; accessibility and system foundations.	Verified institutional scale; representative usability evidence; system and accessibility rules.

Finding
Name the exact behavior or failure observed in the round.

Change
Show the screen or system rule that changed because of it.

Evidence
Report what improved, what remained unresolved, and what moved to future scope.

> Testing is not a separate chapter after design. It is the mechanism that turns one fidelity level into the next.

Accuracy boundary: Tixora and Fundscope label reconstructed research counts, quotes, and screen details as representative. Verified business outcomes and scale remain separate. That disclosure should remain visible in the final case studies.

USE FOR TIXORA AND FUNDSCOPE

A common 18-step spine preserves the reference method.

Section names may change, but this order keeps the problem-solving chain visible from the first question to the final system.

- ✓ **Context and opportunity.** Explain the domain, stakes, and why the work mattered.
- ✓ **Objective, questions, and scope.** Define what the study must learn and what it will not claim.
- ✓ **Secondary evidence.** Put published research before the solution.
- ✓ **Competitive analysis.** Compare capabilities, workflow costs, and the open opportunity.
- ✓ **Primary study plan.** Participants, methods, recruitment logic, and evidence streams.
- ✓ **Interview protocol.** Show the actual questions and task-based prompts.
- ✓ **Survey or behavioral proof.** Size the themes or validate observed patterns.
- ✓ **Affinity or thematic map.** Show clusters, note counts, comments, and implications.
- ✓ **Users and journey.** Make behavioral differences and breakdown points concrete.
- ✓ **Problem statement.** Narrow the evidence to one solvable failure.
- ✓ **Requirements and success signals.** Translate findings into testable behavior.
- ✓ **Ideation.** Show opportunity areas, generated concepts, and alternatives.
- ✓ **Prioritization.** Explain what advanced, what was dropped, and why.
- ✓ **Flow and architecture.** Organize the system around the evidence.
- ✓ **Low-fidelity iteration + Round 1.** Test sequence and task structure.
- ✓ **Mid-fidelity iteration + Round 2.** Test hierarchy, labels, state, and recovery.
- ✓ **High-fidelity system + Round 3.** Validate the complete responsive experience.
- ✓ **Outcomes, accessibility, reflection, and scope.** Separate verified results from representative evidence.

Traceability rule

For every major final behavior, include a compact chain: **source evidence → synthesized insight → design requirement → iteration → test result → final system.**

FINAL COMPARISON

The method is aligned; the final presentation must protect the evidence chain.

Tixora

Alignment: complete.

- Research evidence and competitive review precede the problem.
- Affinity mapping, quotes, survey proof, and a journey make synthesis visible.
- 48 ideas, prioritization, and three fidelity stages show divergence and convergence.
- Three usability rounds connect changes to the final commerce system.

Fundscope

Alignment: complete.

- Interviews, observation, survey evidence, academic research, and competition establish the problem.
- Affinity themes, role workflows, and requirements narrow the challenge.
- 38 ideas, structural alternatives, prioritization, and three fidelity stages show the design path.
- Three usability rounds connect changes to the final analytics system.

Before either case study is published

1. **Keep screenshots beside decisions**
   Do not separate all research from all screens. Pair each major iteration with the finding that caused it.
2. **Keep methods distinct**
   Label interviews, observations, surveys, external evidence, and representative reconstruction clearly.
3. **Keep the three test loops explicit**
   Each round needs task, finding, change, and result - not only a completion metric.
4. **Keep the complete system visible**
   Show how the final screens connect, not a gallery of isolated interfaces.
5. **Keep claims honest**
   Separate verified outcomes from representative portfolio research and anonymized reconstruction.
6. **Keep the reports separate**
   Tixora and Fundscope remain independent case studies and independent PDFs.

Final verdict: yes - both case studies now use the same problem-solving method as the Intelligent Pricing Model, from evidence through solution and validation.
