UX LAB / REPORT 05

Tixora

A research-first case study of live-event discovery and checkout: interviews, affinity mapping, survey evidence, ideation, iteration, usability validation, final system, and measured outcomes.

ROLE
UX Designer

PLATFORMS
iOS / Android / Web

METHOD
Double Diamond · research to results

CASE STUDY OVERVIEW

Four phases organize the work; they do not replace the work.

The report begins with evidence, defines the problem from that evidence, shows the design evolving through three fidelity levels, records usability-driven changes, and ends with the complete system and verified outcomes.

01 DISCOVER

Evidence gathered

- 14 interviews + live walkthroughs
- 230-response survey + affinity map
- Baymard checkout evidence
- Three-platform competitive review

02 DEFINE

Problem narrowed

- Five synthesis themes
- Two behavioral archetypes
- Six-stage journey
- Design requirements and success signals

03 DEVELOP

Options tested

- 48 concepts + prioritization matrix
- Low-fidelity task structure
- Mid-fidelity hierarchy
- Three validation rounds

04 DELIVER

System shipped

- Cross-platform final flow
- Reusable system foundations
- WCAG 2.1 practices
- Conversion, task-time, and CTR outcomes

Project focus

- Connect event discovery and checkout as one decision journey.
- Preserve event, seat, price, and order context while users advance.
- Surface total cost before commitment becomes risky.
- Reduce non-essential account and form friction.
- Make trust and recovery visible at the moment of uncertainty.

Evidence layers

PRIMARY STUDY 14 interviews, 230 survey responses, observation notes, and three usability rounds.

EXTERNAL published checkout evidence and competitive review.

ANONYMIZED participant details, quotes, and screens are reconstructed to protect the original work.

Confidentiality and accuracy boundary. Tixora is an anonymized name. No real employer name appears. Participant identities, product details, and interface visuals are anonymized. The research sample and findings below form a representative portfolio reconstruction; verified business outcomes remain separated from reconstructed study details.

RESEARCH EVIDENCE FIRST

A mixed-method study traced where confidence breaks before checkout.

The study combined exploratory interviews, live task walkthroughs, a quantitative survey, and iterative usability testing. Each method answered a different question: why people hesitate, how often the pattern appears, and whether a design change resolves it.

14
semi-structured interviews with frequent, occasional, and first-time ticket buyers

8 / 14
participants completed a live screen-share walkthrough of a recent ticket search

230
survey responses used to size the interview themes

3 × 6
moderated usability rounds from low fidelity through responsive high fidelity

Participant mix

- **8 frequent buyers:** purchased three or more live-event tickets in the past year.
- **4 occasional buyers:** purchased one or two tickets in the past year.
- **2 first-time buyers:** actively planning a first purchase.
- **9 mobile-primary / 5 mixed-device:** captured the dominant context without excluding web comparison behavior.

Research questions

- Where does the purchase journey lose context?
- Which price signals create or weaken trust?
- What makes a ticket option feel selected and safe to commit to?
- Which account and form steps feel unnecessary?
- How do customers expect errors, delivery, and confirmation to behave?

METHOD	EVIDENCE PRODUCED	DECISION IT INFORMED
Interviews	Behaviors, expectations, language, and perceived risks.	Problem themes, “how might we” questions, and experience principles.
Walkthrough observation	Pauses, backtracking, cross-checking, and context loss.	Persistent selection, visible filters, and editable review.
Survey	Prevalence of fee, account, mobile, and trust concerns.	Prioritization of transparency and guest checkout.
Usability testing	Task success, time, errors, and comprehension by round.	Low-fi, mid-fi, and high-fi iteration decisions.

Portfolio evidence note: participant identities and raw records are not published. Counts, quotes, and findings are presented as a representative anonymized reconstruction; verified product outcomes are identified separately.

SEMI-STRUCTURED GUIDE

Ten questions moved from real behavior to the moment trust breaks.

Sessions began with a recent purchase, not opinions about an ideal product. Follow-up probes asked participants to show what they did, identify the moment of doubt, and explain what information would have changed the decision.

1. **Recent behavior:** Tell me about the last event ticket you bought or tried to buy. What triggered the search?
2. **Discovery:** How did you decide where to search, and what made an event result feel relevant?
3. **Comparison:** Which details did you compare before selecting a ticket - date, venue, section, view, quantity, or price?
4. **Fee transparency:** At what point did you expect to know the full price? What happened if it changed later?
5. **Selection confidence:** How did you confirm which seat, section, quantity, and price were active?
6. **Trust:** What signals made the ticket and payment feel legitimate?
7. **Account friction:** How did you react when asked to sign in or create an account before buying?
8. **Mobile context:** Which device did you use, and what interruptions or handoffs affected the purchase?
9. **Error recovery:** Describe a time payment or checkout failed. What did you expect the product to preserve or explain?
10. **Confirmation:** After paying, what information did you need immediately to feel the purchase was complete?

MODERATOR PROBES

Show, do not recall

“Can you walk me through the page or a similar journey?”

“Where did you pause, go back, or open another tab?”

Name the decision

“What were you comparing at that moment?”

“What information would have made you continue?”

Separate trust from habit

“Did that signal prove safety or simply look familiar?”

“What would make you abandon even with high intent?”

SESSION STRUCTURE	TIME	CAPTURE
Context and recent purchase	10 min	Trigger, event type, device, urgency, group context
Journey reconstruction	20 min	Steps, comparisons, hesitations, workarounds
Live walkthrough	15 min	Observed pauses, backtracking, state loss, price checks
Reflection and prioritization	10 min	Trust signals, must-have information, ideal recovery

The protocol asked where confidence was lost before it asked participants to evaluate a solution.

CLUSTERING 126 CODED NOTES

Five clusters explain the journey's repeated failure points.

Interview notes were coded by behavior, trigger, consequence, and desired control. Related observations were clustered, named, and tested against the survey before becoming design requirements.

Price transparency · 31 notes

"If the price changes on the last screen, I feel tricked."

"I compare the final price, not the face value."

Meaning: late fees do not add detail; they rewrite the decision.

Context continuity · 27 notes

"I opened two sections and forgot which one I had picked."

"Keep the seat and total visible while I move forward."

Meaning: context loss creates backtracking and selection doubt.

Account friction · 22 notes

"I do not want an account for one concert."

"Let me buy first; I can save it afterward."

Meaning: identity setup is optional; purchase intent is not.

Mobile momentum · 25 notes

"I usually buy on my phone while messaging friends."

"Back took me too far and I lost the option."

Meaning: interruption and navigation amplify state loss.

Trust + recovery · 21 notes

"Tell me what failed; do not wipe the form."

"Confirmation should say when the ticket arrives."

Meaning: operational clarity is more credible than generic reassurance.

Cross-cluster insight

Loss
Context, price, or input disappears.

›

Response
Pause, backtrack, compare elsewhere, or abandon.

Design implication: preserve the decision state and make every commitment reversible until payment.

Raw evidence
14 interview transcripts + 8 walkthroughs

›

Synthesis
126 notes grouped into five recurring themes

›

Design focus
Continuity, transparency, speed, trust, and recovery

QUANTITATIVE EVIDENCE

The survey sizes the same risks the interviews exposed.

A 230-response survey tested whether the qualitative patterns were isolated stories or common purchase barriers. Percentages below are calculated from the persisted response counts shown in the chart.

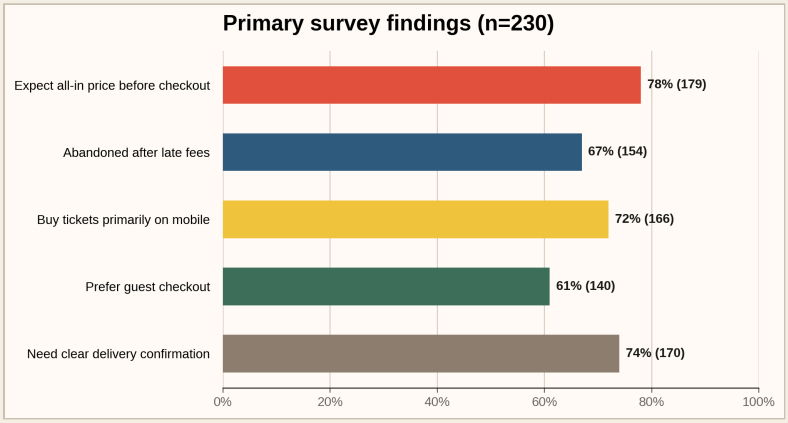

FIG. 01 - Representative primary survey findings (n=230).

78%
expected the full price before entering checkout

67%
had abandoned at least once after a late price increase

74%
said delivery timing affects post-payment confidence

OBSERVED BEHAVIOR IN EIGHT LIVE WALKTHROUGHS

OBSERVED PATTERN	SESSIONS	WHAT HAPPENED	DESIGN IMPLICATION
Repeated price cross-check	6 / 8	Participants moved between ticket list and review to verify whether fees had changed.	Show all-in price before selection and preserve the same total.
Selection backtracking	5 / 8	Participants reopened a seat or ticket option to confirm section, quantity, or view.	Keep a persistent selected-ticket summary.
Account hesitation	4 / 8	Participants paused at sign-in and looked for a guest path.	Make guest checkout primary; defer account creation.
Mobile interruption	5 / 8	Switching to messages or payment disrupted comparison state.	Retain state and make return behavior predictable.
Confirmation uncertainty	3 / 8	Participants searched for delivery timing immediately after payment.	State delivery, access, and support in confirmation.

The survey and observation figures are a representative anonymized portfolio reconstruction. They demonstrate the research logic without exposing proprietary records or participant identities.

EXTERNAL EVIDENCE

Checkout friction is measurable, and four preventable risks map directly to the design.

Baymard reports a 70.22% average documented online cart abandonment rate across 50 studies. That is a market benchmark, not Tixora's own abandonment rate.

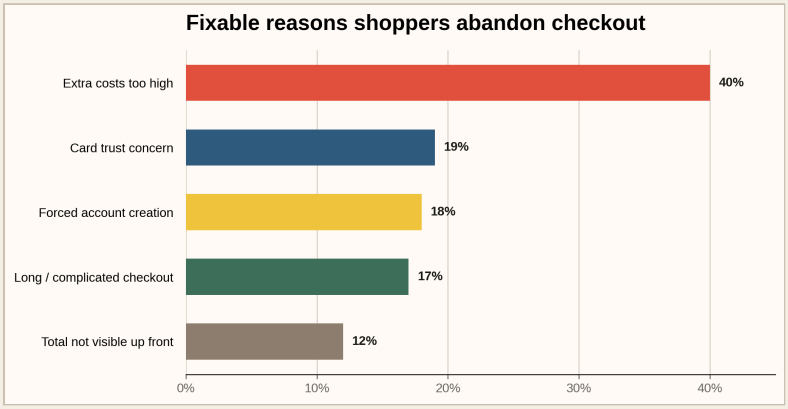

FIG. 01 - Published reasons for abandonment, excluding browsing/not-ready behavior. Source: Baymard Institute.

70.22% benchmark

Average documented cart abandonment across 50 studies. The benchmark establishes the scale of the category risk; it does not diagnose Tixora by itself.

Form-effort benchmark

Baymard states an ideal checkout can be as short as **12-14 form elements**, while its benchmark shows an average of 23.48 elements displayed by default.

PUBLISHED EVIDENCE	RISK TRANSLATED FOR TICKETING	DESIGN RESPONSE CARRIED FORWARD
40%: extra costs too high	A seat may feel affordable until fees appear late.	Show fee line items and the running total before payment.
19%: card-information distrust	Payment uncertainty can break a high-intent purchase.	Use precise labels, recognizable methods, inline errors, and clear confirmation.
18%: account creation required	An account wall interrupts a customer who is ready to buy.	Offer guest checkout and defer optional account setup.
17%: checkout too long or complicated	Every extra field competes with time-sensitive purchase momentum.	Ask only for transaction-critical information and group related inputs.
12%: total cost unavailable up front	Customers cannot compare seats honestly without a total.	Carry all-in cost through selection, review, and payment.

Sources: https://baymard.com/lists/cart-abandonment-rate · https://baymard.com/research/checkout-usability

CATEGORY EVIDENCE

Market leaders make seat context, total price, and trust visible - but continuity remains the differentiator.

The review compared category patterns, not brand aesthetics. The question was which information and reassurance should stay present from event discovery through ticket access.

PLATFORM	OBSERVED STRENGTHS	OPPORTUNITY EXPOSED	TIXORA PRINCIPLE
Ticketmaster	Seat-map comparison, view-from-seat context, accessibility filters, all-in pricing, verified tickets, multiple payment methods, and post-purchase mobile access.	The journey spans account, payment, ticket access, transfer, and sometimes partner apps; state continuity must remain explicit.	Keep the selected event, seat, total, and next step visible across handoffs.
StubHub	Interactive seat maps and 3D views, price and section filters, Google Pay, mobile tickets, order tracking, and a ticket guarantee.	Rich discovery can create information density; the chosen ticket must remain unmistakable as the user advances.	Use persistent selected states and progressive disclosure rather than competing detail.
Vivid Seats	All-in pricing, buyer guarantee, delivery reassurance, and rewards attached to repeat purchase.	Trust claims are strongest when paired with visible order details and concrete recovery behavior.	Place reassurance next to the risk: price, payment, delivery, and confirmation.

Pattern 01 · comparison

Seat maps, filters, and view context support evaluation. Tixora must preserve those choices when the user moves to review.

Pattern 02 · transparency

All-in pricing has become a category expectation. Tixora treats total price as persistent decision context.

Pattern 03 · assurance

Guarantees and verified-ticket language reduce ambiguity. Tixora complements claims with clear states and recovery.

Competitive parity is not the goal. The opportunity is a calmer journey in which context never has to be rediscovered.

Ticketmaster: buying flow, seat-map comparison, all-in pricing, payment, mobile ticket access, and transfer. https://blog.ticketmaster.com/nfl-tickets/

StubHub: app listing covering interactive maps, payment, mobile tickets, tracking, and guarantee. https://play.google.com/store/apps/details?id=com.stubhub&hl=en_IN&gl=US

Vivid Seats: all-in pricing, buyer guarantee, delivery, and rewards. https://www.VividSeats.com/lpga-tour-championship-tickets-tiburon-naples-golf-club-11-21-2024--sports-pga-golf/production/4736132

RESEARCH SYNTHESIS

Confidence decays when context, cost, or control disappears.

The interview clusters, 230-response survey, observed walkthroughs, Baymard evidence, and competitive patterns converge on five failure modes. The problem statement comes after this synthesis - not before it.

01 · Context fragmentation
Event, ticket, seat, or price information can disappear between comparison and review, forcing backtracking.

02 · Commitment surprise
Fees or totals revealed late change the meaning of earlier choices.

03 · Non-essential friction
Account creation and excess fields interrupt purchase momentum.

04 · Weak selection clarity
Dense ticket options make it easy to lose which seat, section, quantity, or price is active.

05 · Invisible trust and recovery
Generic reassurance cannot replace understandable labels, errors, payment states, and confirmation.

Synthesis rule: each theme had to connect to a research signal and a testable interface behavior. Themes that could not change a decision were excluded.

Defined problem statement

> People need to compare, commit, and pay without losing context, encountering avoidable effort, or questioning whether the purchase is safe.

How might we...

- keep event, seat, quantity, and cost visible as the journey advances?
- show the full financial commitment before payment?
- support fast purchase without requiring an account?
- reduce fields without weakening completion or security?
- make errors and recovery understandable at the point of failure?

What the solution must not do

- Hide late cost behind a low initial price.
- Use trust language without concrete interface behavior.
- Make mobile and web feel like unrelated products.
- Trade accessibility for visual density.
- Attribute an end-to-end outcome to one isolated UI change.

Define output: one problem centered on continuity, plus five behaviors the product can test.

BEHAVIORAL ARCHETYPES

Two purchase modes move at different speeds but need the same stable context.

The archetypes are decision modes, not demographic personas. A single customer may switch between them depending on the event, group, urgency, and budget.

ANONYMIZED RECONSTRUCTION

The event planner

Compares dates, locations, price bands, and seating options before coordinating a group purchase.

- **Job:** choose an option that the group can verify and accept.
- **Needs:** comparison, retained context, clear totals, editable review.
- **Risk:** losing a candidate option while checking another.
- **Success:** can explain exactly what was chosen and why.

ANONYMIZED RECONSTRUCTION

The decisive fan

Arrives with a specific event or strong intent and wants the fastest trustworthy path to a valid ticket.

- **Job:** secure the right ticket before availability changes.
- **Needs:** clear selection, total price, guest access, fast payment.
- **Risk:** interruption by optional steps or ambiguous errors.
- **Success:** reaches confirmation without questioning the order.

JOURNEY MAP

Discover	Compare	Select	Review	Pay	Confirm
Search or browse relevant events.	Evaluate date, venue, seat, and price.	Choose section, quantity, and ticket.	Verify details, fees, and total.	Complete minimum required inputs.	Understand success, delivery, and next step.

MOMENT	USER QUESTION	DESIGN REQUIREMENT	FAILURE SIGNAL
Compare	Which option fits my priorities?	Keep filters, seat context, and price comparable.	Repeated opening, closing, or backtracking.
Select	What exactly did I choose?	Use a persistent, non-color-only selected state.	Ticket or quantity changes unintentionally.
Review	Is this the real total?	Show line items, fees, and editable order details.	Exit after total appears.
Pay	Can I finish quickly and safely?	Guest path, minimum fields, inline validation.	Field errors, account-wall exits, long task time.
Confirm	What happens now?	Clear success, delivery timing, and ticket access.	Support-seeking immediately after purchase.

INFORMATION ARCHITECTURE

The architecture places reassurance where the decision occurs.

The final structure does not isolate trust in a policy page. Context, price, editability, form guidance, and confirmation appear at the moments they can change behavior.

01 Search	02 Results	03 Tickets	04 Review	05 Checkout	06 Success
Intent, location, date	Filters, event cards	Map, list, quantity	Details, fees, edit	Guest, payment, errors	Delivery, access, support

REQUIREMENT	EVIDENCE	INTERFACE BEHAVIOR	SUCCESS SIGNAL
Preserve context	Qualitative continuity theme	Sticky event/ticket summary and visible selected state.	Fewer reversals and faster completion.
Reveal total early	40% extra costs; 12% total unavailable	All-in price in comparison; itemized total at review.	Higher progression from review to payment.
Keep access optional	18% forced account creation	Guest checkout first; account invitation after success.	Lower account-wall exits.
Reduce form effort	17% long/complex checkout; 12-14 element ideal	Minimum fields, sensible grouping, saved-method support.	Lower task completion time.
Make trust operational	19% card distrust	Precise labels, payment methods, visible errors, recovery and confirmation.	Higher completion and fewer payment retries.
Protect access	WCAG 2.1 design practice	Focus visibility, semantic labels, touch targets, non-color cues.	95% compliance in the verified audit record.

Primary outcome

Conversion: measure completion of the redesigned discovery-to-purchase journey.

Effort outcome

Task time: measure whether the connected flow reduces unnecessary work.

Engagement outcome

Click-through rate: measure whether revised hierarchy makes the next action clearer.

Causality boundary: the final metrics describe the redesigned journey and A/B experiment outcomes. They do not prove that any one individual pattern caused the full lift.

STRUCTURED CONCEPT GENERATION

Forty-eight ideas expanded the solution space before the team converged.

The team used “How might we” prompts, Crazy 8s, constraint reversal, and competitor pattern critique. Concepts were deliberately generated across the whole journey so checkout would not be treated as an isolated payment page.

11	10	9	8	6	4
price transparency	context continuity	comparison + selection	checkout speed	trust + recovery	post-purchase

How might we preserve context?

- Sticky event + ticket summary
- Linked map/list selection
- Persistent filter chips
- Save-and-compare tray
- Back navigation with retained state

How might we expose commitment?

- All-in price in results
- Fee preview on ticket cards
- Editable order review
- Price-change explanation
- Budget ceiling filter

How might we protect momentum?

- Guest-first checkout
- Progressive field grouping
- Saved payment support
- Inline error recovery
- Account invitation after purchase

Divergence rules

- Generate at least one structural, content, and interaction response per theme.
- Separate “familiar” from “evidence-aligned.”
- Include a deliberately minimal option and an ambitious option.
- Do not score ideas until all six territories are represented.

Convergence criteria

- **User value:** directly answers a high-frequency theme.
- **Confidence:** supported by more than one method.
- **Effort:** feasible across iOS, Android, and web.
- **Risk:** testable before production.
- **Accessibility:** state and action remain perceivable and operable.

48 raw ideas
Six opportunity territories

›

18 grouped concepts
Duplicates merged; weak evidence removed

›

7 prototype candidates
Highest combined value, confidence, and feasibility

DECISION MATRIX

Evidence and feasibility decided what moved into the prototype.

Ideas were scored against user impact, evidence confidence, cross-platform effort, implementation risk, and accessibility. The matrix records not just the winners, but why attractive alternatives were deferred or rejected.

Pursue now · high impact / lower effort

- All-in price from results onward
- Persistent selected-ticket summary
- Guest-first checkout
- Editable order review
- Grouped payment fields
- Inline recovery with retained input
- Delivery timeline in confirmation

Prototype deeply · high impact / higher effort

- Linked seat map and ticket list
- Responsive sticky action and summary
- Cross-device state continuity
- Accessible, non-color-only selection system

Defer · useful, not core to the problem

- Group voting on ticket options
- Price-drop alerts
- Split payment
- Saved comparison across events

Why: useful for planning, but not required to prove the core continuity and transparency model.

Drop · conflicts with evidence

- Countdown pressure on every screen
- Mandatory account before payment
- Auto-selected add-ons
- One long unstructured checkout page

Why: each pattern adds uncertainty, effort, or manipulation at the moment users need control.

PROTOTYPE CANDIDATE	PRIMARY EVIDENCE	HYPOTHESIS TO TEST	SUCCESS CONDITION
Persistent summary	27 continuity notes; 5/8 backtracked	Visible state will reduce rechecking.	At least 5/6 identify the active ticket without returning.
All-in price	78% expect total early; 67% abandoned after late fees	Stable totals will increase review confidence.	At least 5/6 state the full cost before payment.
Guest-first path	61% prefer guest; 4/8 hesitated at sign-in	Removing the account wall will protect momentum.	At least 5/6 choose and complete the guest path.
Inline recovery	21 trust/recovery notes	Specific errors with retained input will reduce retries.	At least 5/6 correct the error without restarting.

The chosen system is not a collection of favorite features; it is the smallest set of behaviors that answers the strongest evidence.

LOW-FIDELITY SCREENS

Round one tests task order, not visual preference.

The first prototype asks whether a customer can move from results to purchase while maintaining event, ticket, and cost context. These screens reconstruct the documented interaction logic for review.

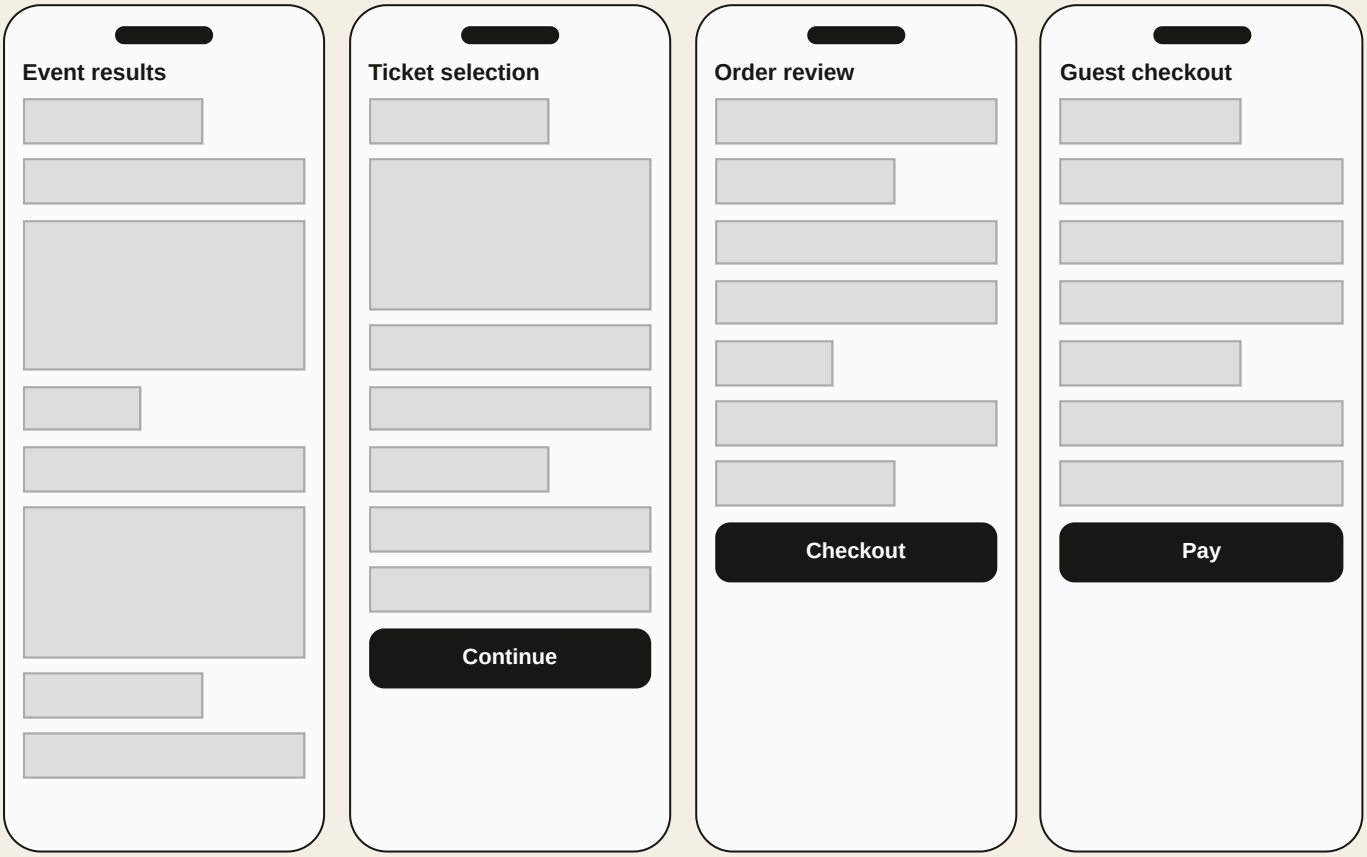

FIG. 02A
Scan results and understand filter priority.

FIG. 02B
Choose a ticket without losing event context.

FIG. 02C
Verify details and total before commitment.

FIG. 02D
Complete the task without mandatory account creation.

OBSERVED RISK TO TEST	LOW-FIDELITY CHANGE	REASON
Filters compete with results	Move active filters into a compact summary above the list.	Supports scanning without hiding state.
Selection is easy to lose	Add a persistent ticket summary below the seat/list workspace.	Keeps section, quantity, and cost visible.
Total arrives too late	Introduce fees and total at review, before payment fields.	Addresses cost surprise before commitment.
Account wall interrupts momentum	Make guest checkout the primary access path.	Removes a non-essential blocker.

ANONYMIZED RECONSTRUCTION Visuals are rebuilt from the reported flow and decision logic; they are not original production captures.

MID-FIDELITY SCREENS

Round two makes selection, total cost, and recovery explicit.

The second prototype adds realistic labels and hierarchy. The design remains neutral so testing can focus on comprehension, comparison, and form behavior.

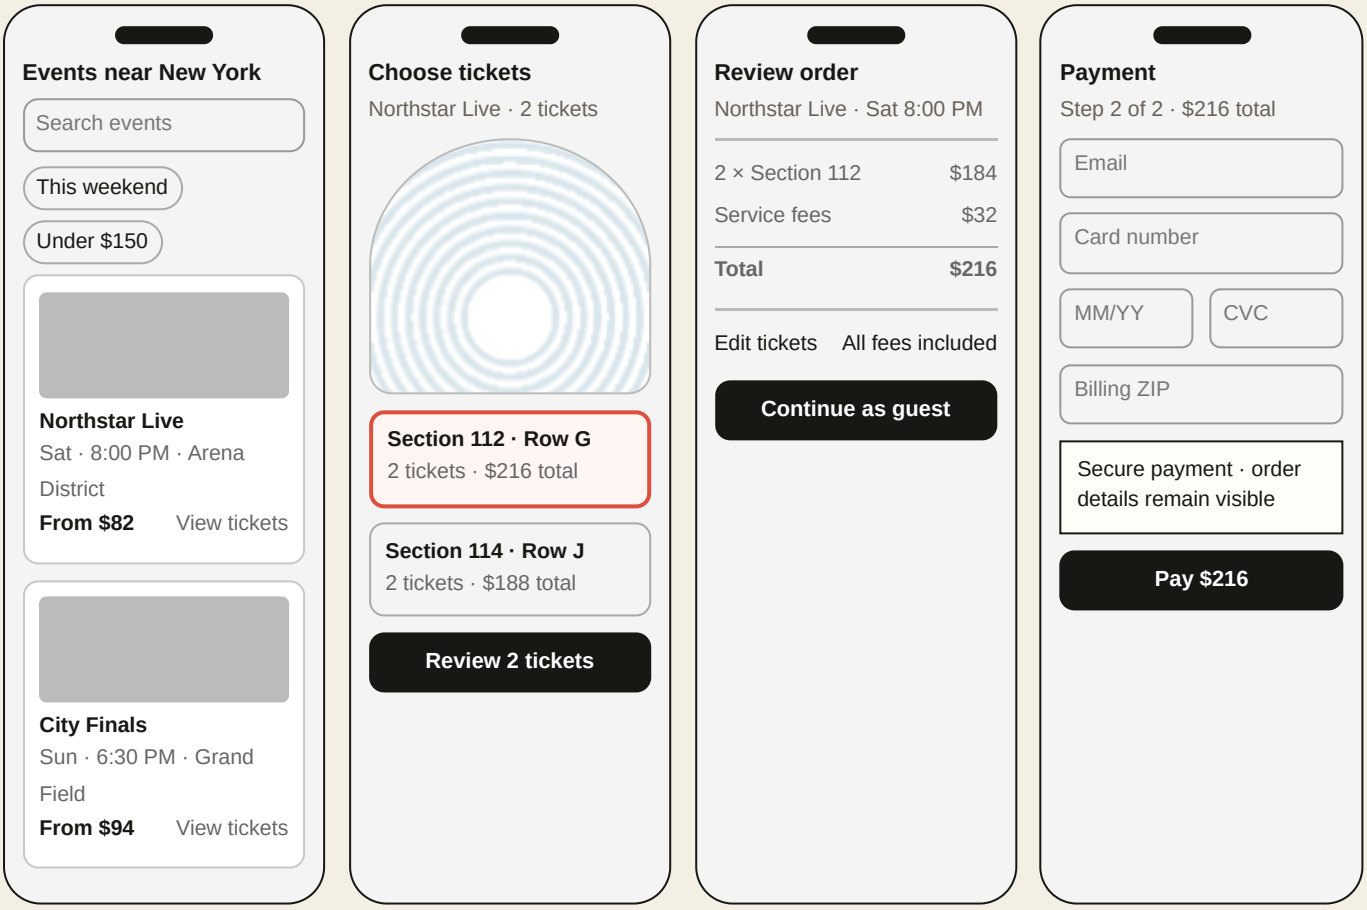

FIG. 03A
Applied filters remain visible while scanning.

FIG. 03B
Selected ticket uses border, fill, text, and summary.

FIG. 03C
Fees and total appear before payment.

FIG. 03D
Five grouped inputs keep the task focused.

WHAT CHANGED FROM LOW FIDELITY	WHY IT CHANGED	WHAT THE NEXT TEST CHECKS
All-in price added to ticket options	Customers need honest comparison before review.	Can users compare without recalculating later?
Selected state gains multiple cues	Color alone is insufficient and dense lists are error-prone.	Can users identify the active ticket immediately?
Review becomes editable	Control reduces fear of irreversible commitment.	Can users change quantity or seat without restarting?
Payment fields reduced and grouped	Baymard links excessive form effort to abandonment.	Can users complete and recover from an error quickly?

TESTING RECORD · SIX PARTICIPANTS PER ROUND

Each round exposed a failure, changed the prototype, and improved the next task run.

Eighteen moderated sessions followed the same purchase scenario: find an event under budget, compare two ticket options, select two seats, verify the total, continue as a guest, recover from one payment error, and explain ticket delivery.

4/6 → 6/6
participants completing the core flow without moderator help

6:20 → 4:17
median task time from low fidelity to responsive high fidelity

5 → 1
median critical errors per round across the scripted task

ROUND 01 · LOW FIDELITY · N=6

Flow + context

- **4/6** completed without help.
- **4/6** missed the full total before payment.
- **3/6** lost track of the selected ticket.
- **2/6** could not find how to edit at review.

Changed: all-in price moved earlier; sticky selected-ticket summary; persistent filters; explicit edit path.

ROUND 02 · MID FIDELITY · N=6

Checkout + recovery

- **5/6** completed without help.
- **2/6** overlooked the guest option.
- **3/6** hesitated at generic card-error copy.
- **2/6** questioned whether input would be preserved.

Changed: guest became the primary CTA; fields were grouped; errors named the fix; form and order state persisted.

ROUND 03 · HIGH FIDELITY · N=6

Responsive + accessible

- **6/6** completed without help.
- **6/6** stated the full cost correctly.
- **5/6** recovered from the injected error first try.
- **6/6** explained delivery and next steps.

Changed: stronger focus treatment; stable mobile CTA; non-color selection cues; explicit delivery status.

ITERATION CHAIN

OBSERVED	CHANGED	RETESTED	RESULT
Late total and weak selected state.	All-in price + sticky summary.	Cost and ticket recall.	6/6 stated both correctly.
Guest path and error recovery were unclear.	Primary guest CTA + specific inline error.	Completion after injected failure.	5/6 recovered first try.
Desktop patterns compressed poorly on mobile.	Stable mobile action + progressive detail.	Same task across breakpoints.	6/6 completed without help.

Usability counts are part of the representative anonymized research reconstruction. Verified product-level outcomes appear later and are not derived from these small prototype rounds.

HIGH-FIDELITY SYSTEM

The final flow keeps event, selection, and all-in cost visible.

The visual language is reconstructed for confidentiality. The interaction model reflects the documented solution: clear hierarchy, persistent context, predictable actions, and transparent commitment.

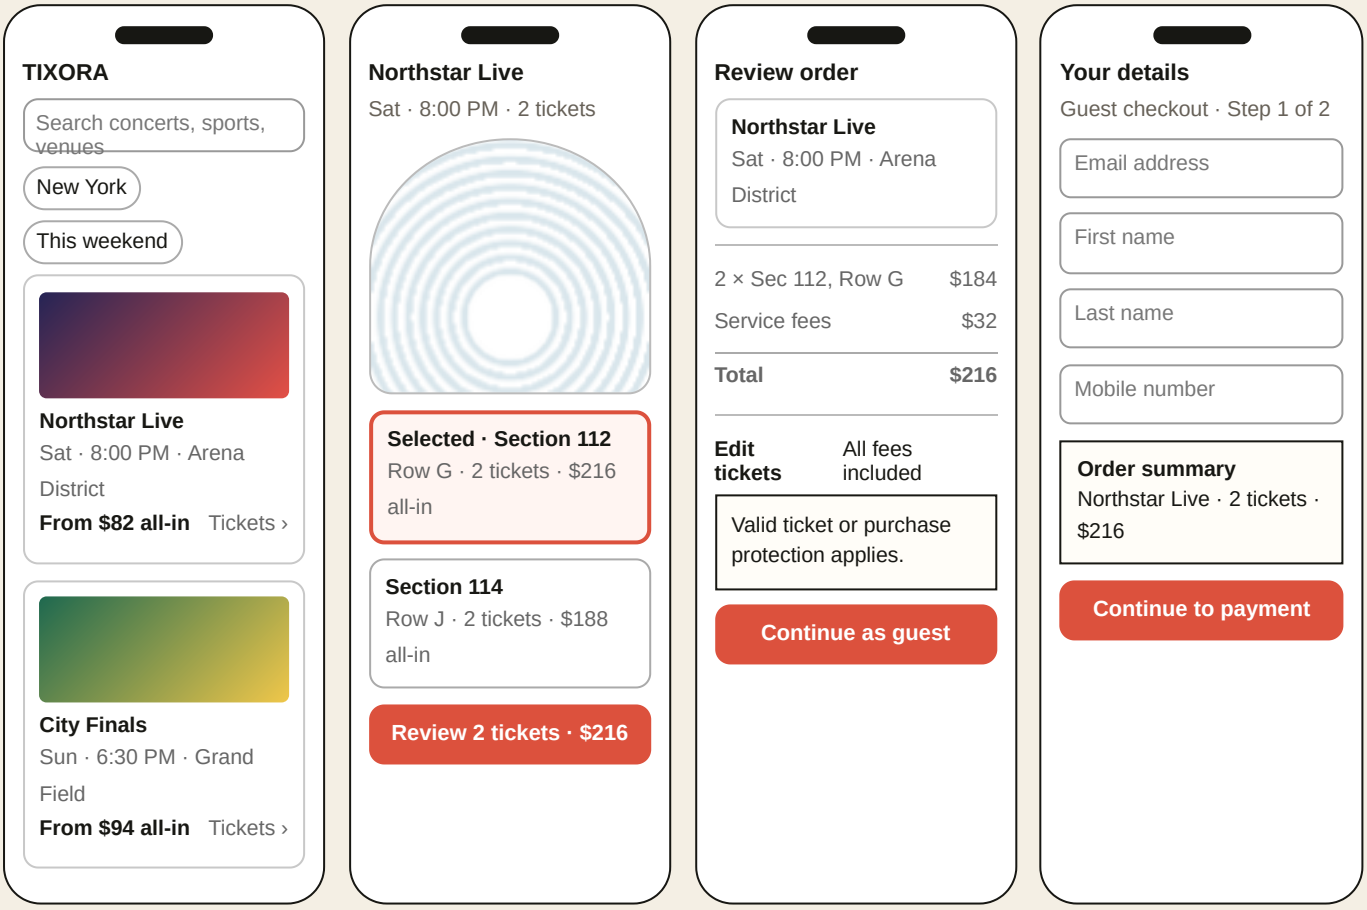

FIG. 04A · Results
All-in prices support honest comparison.

FIG. 04B · Tickets
Map and list share one selected state.

FIG. 04C · Review
Line items, editability, and assurance appear together.

FIG. 04D · Guest
Necessary contact details only; account setup is deferred.

DESIGN DECISION	EVIDENCE ANSWERED	SYSTEM BEHAVIOR
All-in price from results onward	40% extra cost; 12% total not visible	The same total follows comparison, selection, and review.
Persistent selected-ticket card	Context-fragmentation theme	Map, list, and summary update as one state.
Guest-first checkout	18% forced account creation	Purchase proceeds without an account; sign-up moves after success.

HIGH-FIDELITY SYSTEM

Payment makes security, error recovery, and the next step legible.

Trust is expressed through concrete behavior: clear labels, retained order context, inline correction, unambiguous success, and accessible ticket-delivery information.

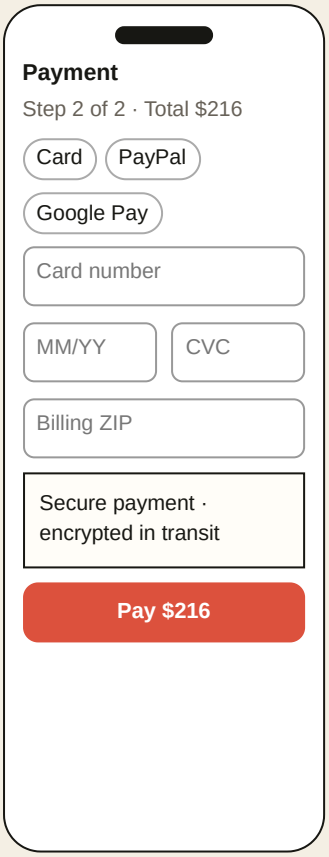

FIG. 05A · Payment
Methods, labels, and total remain visible.

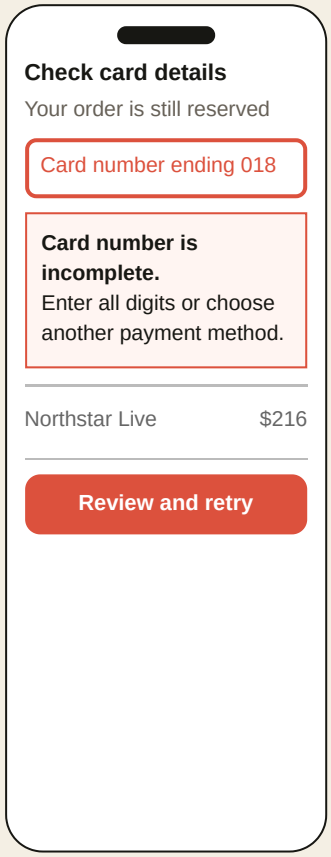

FIG. 05B · Recovery
Error names the problem and preserves the order.

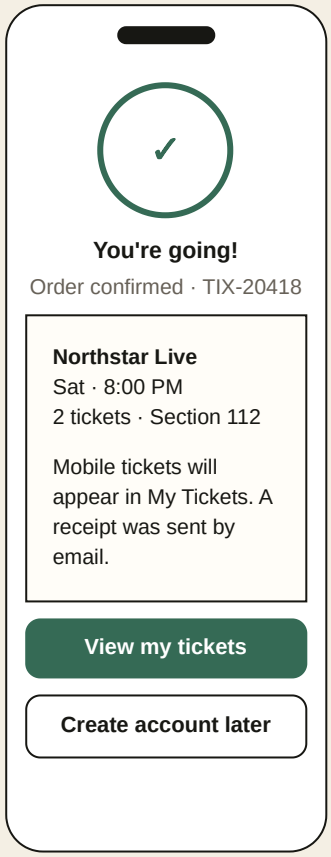

FIG. 05C · Confirmation
Success explains ticket delivery and next action.

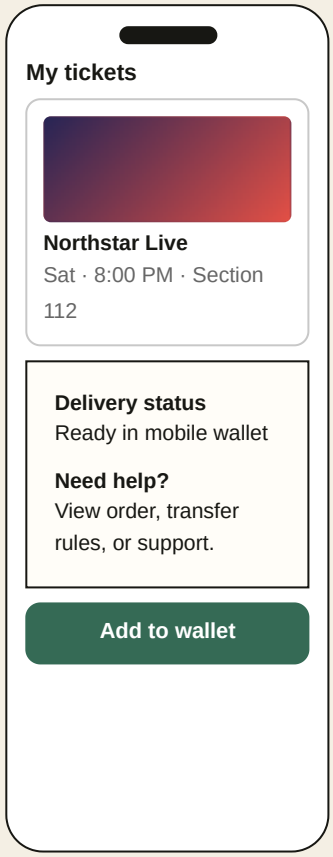

FIG. 05D · Ticket access
Post-purchase status closes the trust loop.

SYSTEM AND ACCESSIBILITY FOUNDATIONS

100+ components
Verified broader design-system scale across four product teams.

Selection states
Border, fill, label, and summary communicate state beyond color.

Form behavior
Persistent labels, inline errors, retained input, and recovery guidance.

Responsive rules
Shared intent and state; layout adapts without changing interaction meaning.

Keyboard and focus
Visible location, predictable order, and operable controls.

95% WCAG 2.1
Verified audit result from the broader product work.

VERIFIED RESULTS

The end-to-end redesign improved conversion, speed, and action clarity.

These metrics are verified from the résumé record. They describe the redesigned journey and A/B testing results, not isolated effect sizes for one component.

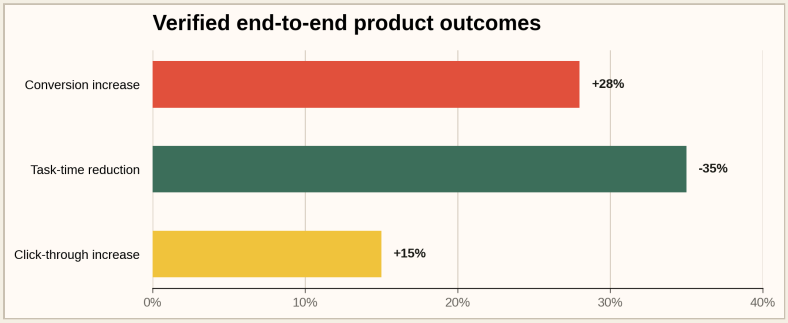

FIG. 06 - Verified change from each relevant experiment baseline.

+28%
conversion after redesigning ticket discovery and checkout

-35%
task completion time across the redesigned flow

+15%
click-through rate from A/B testing

EVIDENCE-TO-OUTCOME CHAIN

PROBLEM	EVIDENCE	DECISION	OUTCOME SIGNAL
Late cost weakens confidence.	40% extra costs; 12% total unavailable.	All-in price and itemized review.	+28% conversion across the full journey.
Account and form effort interrupt momentum.	18% forced accounts; 17% long checkout.	Guest-first access and minimum fields.	-35% task completion time.
Competing hierarchy obscures the next action.	Qualitative continuity and selection themes.	One dominant action and persistent context.	+15% click-through rate in A/B testing.
Payment uncertainty blocks completion.	19% card-information distrust.	Precise labels, inline errors, recovery, confirmation.	Included in the +28% end-to-end conversion result.

Interpretation: external evidence explains why the risks were prioritized. The Tixora outcomes validate the complete redesign; they do not prove that a single pattern produced the entire change.

Learning: checkout performance is shaped before payment. Discovery quality, comparison clarity, system consistency, transparent commitment, and accessible recovery all influence whether a customer feels ready to complete a purchase.

REFERENCES

Primary synthesis, external benchmarks, and product outcomes remain distinct.

Representative primary study. Fourteen interviews, eight live walkthroughs, 230 survey responses, 126 coded affinity notes, and three usability rounds of six participants. Participant details, quotes, and counts are anonymized portfolio reconstructions rather than published raw records.

EVIDENCE CHAIN

LAYER	WHAT IT ESTABLISHES	HOW IT IS USED
Interviews + affinity map	Why confidence breaks and what customers expect.	Problem themes, language, and experience principles.
Survey + observations	How common the themes are and where behavior fails.	Prioritization and success criteria.
External evidence	Category-scale checkout and trust risks.	Triangulation, not a substitute for primary research.
Usability rounds	Whether specific interface decisions solve the task failures.	Iteration from low fidelity to high fidelity.
Verified product metrics	Performance of the complete redesigned journey.	+28% conversion, -35% task time, +15% CTR.

Confidentiality preserved

- Tixora remains the only product name.
- No real employer name appears.
- Participant identities and proprietary screens are omitted.
- Interface visuals are reconstructed.

Claims kept separate

- Research reconstruction explains the problem-solving logic.
- Published sources support category evidence.
- Résumé-backed metrics report verified outcomes.
- No single UI pattern is assigned the full lift.
